**CHEMICAL COMPOUNDS**

The present invention relates to chemical compounds, to their production as well as to pharmaceutical compositions containing them as well as to their use in therapy, in particular  
5 of inflammatory disease.

MCP-1 is a member of the chemokine family of pro-inflammatory cytokines which mediate leukocyte chemotaxis and activation. MCP-1 is a C-C chemokine which is one of the most potent and selective T-cell and monocyte chemoattractant and activating agents known. MCP-1 has been implicated in the pathophysiology of a large number of inflammatory  
10 diseases including rheumatoid arthritis, glomerular nephritides, lung fibrosis, restenosis (International Patent Application WO 94/09128), alveolitis (Jones et al., 1992, *J. Immunol.*, **149**, 2147) and asthma. Other disease areas where MCP-1 is thought to play a part in their pathology are atherosclerosis (e.g. Koch et al., 1992, *J. Clin. Invest.*, **90**, 772 -779), psoriasis (Deleuran et al., 1996, *J. Dermatological Science*, **13**, 228-236), delayed-type  
15 hypersensitivity reactions of the skin, inflammatory bowel disease (Grimm et al., 1996, *J. Leukocyte Biol.*, **59**, 804-812), multiple sclerosis and brain trauma (Berman et al, 1996, *J. Immunol.*, **156**, 3017-3023). An MCP-1 inhibitor may also be useful to treat stroke, reperfusion injury, ischemia, myocardial infarction and transplant rejection.

MCP-1 acts through the MCP-1 receptor (also known as the CCR2 receptor). MCP-2  
20 and MCP-3 may also act, at least in part, through the MCP-1 receptor. Therefore in this specification, when reference is made to "inhibition or antagonism of MCP-1" or "MCP-1 mediated effects" this includes inhibition or antagonism of MCP-2 and/or MCP-3 mediated effects when MCP-2 and/or MCP-3 are acting through the MCP-1 receptor.

Copending International Patent Application Nos. PCT/GB98/02340 and  
25 PCT/GB98/02341 describe and claim groups of compounds based upon the indole ring structure which are inhibitors of MCP-1 and therefore have applications in therapy.

The use of certain indole derivatives as NMDA antagonists is described in USP5051442, WO9312780, EP-483881. Other indoles and their use as inhibitors of leukotriene biosynthesis is described in for example, EP-A- 275-667.

The applicants have found a particular substitution on the indole ring produces advantageous results when used therapeutically as inhibitors of MCP-1.

According to the present invention there is provided the use of a compound of formula

R<sup>2</sup> is carboxy, cyano, -C(O)CH<sub>2</sub>OH, -CONHR<sup>8</sup>, -SO<sub>2</sub>NHR<sup>9</sup>, tetrazol-5-yl, SO<sub>3</sub>H, or a group of formula (VI)

(VI)

15

where R<sup>8</sup> is selected from hydrogen, alkyl, aryl, cyano, hydroxy, -SO<sub>2</sub>R<sup>12</sup> where R<sup>12</sup> is alkyl, aryl, heteroaryl, or haloalkyl; or R<sup>8</sup> is a group -(CHR<sup>13</sup>)<sub>r</sub>-COOH where r is an integer of 1-3 and each R<sup>13</sup> group is independently selected from hydrogen or alkyl; R<sup>9</sup> is hydrogen, alkyl, optionally substituted aryl such as optionally substituted phenyl or optionally substituted heteroaryl such as 5 or 6 membered heteroaryl groups, or a group COR<sup>14</sup> where R<sup>14</sup> is alkyl, aryl, heteroaryl or haloalkyl; R<sup>10</sup> and R<sup>11</sup> are independently selected from hydrogen or alkyl, particularly C<sub>1-4</sub> alkyl;

20

$R^3$  is a group  $OR^{15}$ ,  $S(O)_qR^{15}$ ,  $NHCO R^{16}$ ,  $NHSO_2R^{16}$ ,  $(CH_2)_sCOOH$ ,  $(CH_2)_tCONR^{17}R^{18}$ ,  $NR^{17}R^{18}$ ,  $SO_2NR^{17}R^{18}$  or optionally substituted alkenyl, where  $q$  is 0, 1 or 2,  $s$  is an integer of from 1 to 4,  $t$  is 0 or an integer of from 1 to 4,  $R^{15}$  is a substituted alkyl or cycloalkyl group or an optionally substituted heteroaryl group,  $R^{16}$  is optionally substituted alkyl, optionally substituted aryl or optionally substituted heteroaryl and  $R^{17}$  and  $R^{18}$  are independently selected from hydrogen, optionally substituted alkyl, optionally substituted aryl and optionally substituted heteroaryl, with the proviso that at least one of  $R^{17}$  or  $R^{18}$  is other than hydrogen, or  $R^{16}$  and  $R^{17}$  together with the nitrogen atom to which they are attached form an optionally substituted heterocyclic ring which optionally contains further heteroatoms; and

10  $R^4$ ,  $R^5$ ,  $R^6$  and  $R^7$  are independently selected from hydrogen, a functional group or an optionally substituted hydrocarbyl groups or optionally substituted heterocyclic groups: for use in the preparation of a medicament for the inhibition of monocyte chemoattractant protein-1 and/or RANTES induced chemotaxis.

Compounds of formula (I) are inhibitors of monocyte chemoattractant protein-1. In addition, they appear to inhibit RANTES induced chemotaxis. RANTES is another chemokine from the same family as MCP-1, with a similar biological profile, but acting through the CCR1 receptor. As a result, these compounds can be used to treat disease mediated by these agents, in particular inflammatory disease. Thus the invention further provides a compound of formula (I) for use in preparation of a medicament for the treatment of inflammatory disease.

Examples of  $\alpha$ -acyloxyalkyl ethers include acetoxymethoxy and 2,2-dimethylpropionyloxymethoxy. A selection of *in vivo* hydrolysable ester forming groups for hydroxy include alkanoyl, benzoyl, phenylacetyl and substituted benzoyl and phenylacetyl, alkoxycarbonyl (to give alkyl carbonate esters), dialkylcarbamoyl and *N*-(dialkylaminoethyl)-*N*-alkylcarbamoyl (to give carbamates), dialkylaminoacetyl and carboxyacetyl.

Esters which are not *in vivo* hydrolysable are useful as intermediates in the production of the compounds of formula (I) and therefore these form a further aspect of the invention.

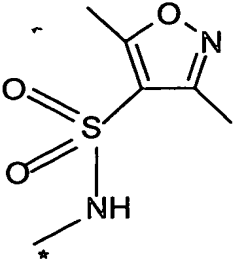

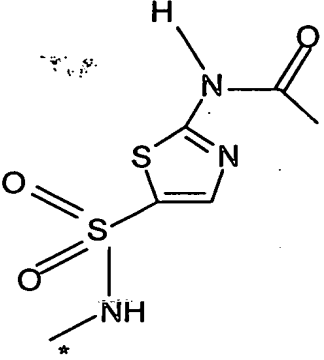

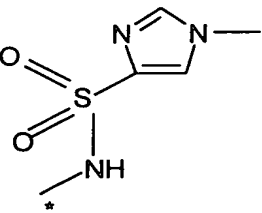

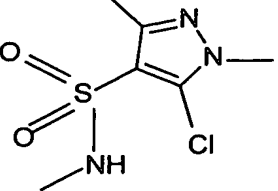

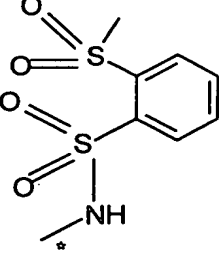

Thus examples of compounds of formula (I) include the following:

- Some compounds of formula (I) have not been proposed hitherto for use as pharmaceuticals. Thus a further aspect of the invention provides a compound for use in
- 5 therapy, said compound comprising a compound of formula (1A) which is a compound of formula (I) as defined above subject to the following provisos:
- (i) when  $\text{R}^2$  is carboxy or a salt or amide thereof, at least three of  $\text{R}^4$ ,  $\text{R}^5$ ,  $\text{R}^6$  and  $\text{R}^7$  are hydrogen, and  $\text{R}^3$  is  $\text{S}(\text{O})_q\text{R}^{15}$ ,  $\text{R}^{15}$  is other than  $\text{C}_{1-4}$  alkyl substituted by carboxy or an ester or amide derivative thereof;
  - 10 (ii) when  $\text{R}^3$  is a group  $\text{NHCOR}^{16}$  or  $\text{NHSO}_2\text{R}^{16}$ ,  $\text{R}^{16}$  is optionally substituted alkyl; and
  - (iii) where  $\text{R}^3$  is a group  $\text{SR}^{14}$  where  $\text{R}^{14}$  is 2-quinolylmethyl,  $\text{R}^2$  is  $\text{COOH}$  or an ethyl ester thereof, each of  $\text{R}^4$ ,  $\text{R}^5$ , and  $\text{R}^7$  are hydrogen,  $\text{R}^1$  is 4-chlorophenyl,  $\text{R}^6$  is other than 2-quinolylmethyl.

- Yet a further aspect of the invention provides pharmaceutical compositions comprising
- 15 a compound of formula (IA) as defined above.

- Certain compounds of formula (I) are novel and these form a further aspect of the invention. Thus the invention further provides a compound of formula (IB) which is a compound of formula (IA) as defined above, subject to the following further provisos:
- (iv) where  $\text{R}^3$  is a group  $\text{CH}_2\text{COOH}$ ,  $\text{R}^2$  is  $\text{COOH}$  and each of  $\text{R}^4$ ,  $\text{R}^5$ ,  $\text{R}^6$  and  $\text{R}^7$  are
  - 20 hydrogen,  $\text{R}^1$  is other than unsubstituted phenyl; and
  - (v) where  $\text{R}^3$  is a group  $\text{CH}_2\text{COOH}$ ,  $\text{R}^2$  is  $\text{COOH}$  and each of  $\text{R}^4$ ,  $\text{R}^5$ , and  $\text{R}^7$  are hydrogen,  $\text{R}^1$  is 4-chlorophenyl,  $\text{R}^6$  is other than methoxy; and

(vi) when  $R^3$  is  $OR^{15}$  or  $S(O)_qR^{15}$ ,  $R^{15}$  is other than  $C_{1-6}$  haloalkyl.

Particularly preferred substituents and groups on the compounds of formula (IA) and (IB) are those described above in relation to formula (I).

Suitable examples of compounds of formula (IB) are compounds where  $R^3$  is a group  
 5  $OR^{15}$  straight or branched chain alkyl group which carries at least one hydroxy group, for example from 1 to 4 hydroxy groups, for example 1 or 2 hydroxy groups. Other substituents, as defined above, may be provided on the alkyl chain.

Preferably  $R^3$  is a group of formula  $-(CH_2)_a[(CHOH)(CH_2)_b]_dCH_2OH$  where a is 0 or an integer of from 1 to 4, b is 0 or an integer of from 1 to 3, and d is 0 or 1.

10 Examples of such  $R^3$  include  $CH_2CHOHCH_2OH$  and  $CH_2CH_2OH$ .

Compounds of formula (I) are suitably prepared by methods such as those described in International Patent Application Nos. PCT/GB98/02340 and PCT/GB98/02341.

In particular compounds of formula (I) can be prepared by reacting a compound of formula (VII)

15

(VII)

where  $R^4$ ,  $R^5$ ,  $R^6$  and  $R^7$  are as defined in relation to formula (I),  $R^2'$  is a group  $R^2$  as defined in relation to formula (I) or a protected form thereof, and  $R^3'$  is a group  $R^3$  as defined in relation to formula (I) or a precursor thereof; with compound of formula (VIII)

20

(VIII)

where  $R^1$  and X are as defined in relation to formula (I) and  $Z^1$  is a leaving group; and  
 25 thereafter if desired or necessary carrying out one or more of the following steps:

(i) changing a precursor group  $R^3'$  to a group  $R^3$  or a group  $R^3$  to a different such group;

(ii) removing any protecting group from R<sup>2'</sup>.

Suitable leaving groups for Z include halide such as chloride, bromide or iodide, as well as mesylate or tosylate. The reaction is suitably effected in an organic solvent such as dimethylformamide (DMF) tetrahydrofuran (THF) or DCM in the presence of a base such as sodium hydride, sodium hydroxide, potassium carbonate. Optionally the reaction is effected in the presence of a suitable phase transfer catalyst. The choice of base and solvent is interdependent to a certain extent in that certain solvents are compatible with some bases only as is understood in the art. For example, sodium hydride may preferably be used with dimethylformamide or tetrahydrofuran and sodium hydroxide is preferably used with dichloromethane and a phase transfer catalyst.

The reaction can be carried out at moderate temperatures, for example from 0 to 50°C and conveniently at about ambient temperature.

Preferably, R<sup>2'</sup> is an ester group in the compound of formula (VII) and this may be subsequently converted to an acid or to another ester or salt, by conventional methods. For example, when X is a group SO<sub>2</sub> and R<sup>2</sup> is a methyl ester of carboxy, it may be converted to the corresponding carboxylic acid by reaction with lithium iodide in dry pyridine or DMF.

Optional step (i) and (ii) above can be carried out using conventional methods. These will depend upon the precise nature of the groups R<sup>3</sup>, R<sup>3'</sup>, R<sup>2</sup> and R<sup>2'</sup> in each case. Examples of suitable reactions are illustrated hereinafter.

Alternatively, compounds of formula (I) may be prepared by reacting a compound of formula (IX)

(IX)

where X, R<sup>1</sup>, R<sup>4</sup>, R<sup>5</sup>, R<sup>6</sup> and R<sup>7</sup> are as defined in relation to formula (I), R<sup>2'</sup> is a group R<sup>2</sup> as defined in relation to formula (I) or a protected form thereof; with a compound of formula (X)

(X)

where R<sup>3'</sup> is a group R<sup>3</sup> as defined in relation to formula (I) or a precursor thereof; and thereafter if desired or necessary carrying out steps (i) and/ or (ii) above.

The reaction is suitably carried out in an organic solvent which will depend upon the nature of the compound of formula (X). Suitable leaving groups Z<sup>1</sup> include those listed above for Z.

Compounds of formula (X) may suitably be prepared by methods analogous to those described above between the compound of formula (VII) and (VIII), although in this case, a compound of formula (VIIA) will be used.

(VIIA)

In this compound, R<sup>2'</sup>, R<sup>4</sup>, R<sup>5</sup>, R<sup>6</sup> and R<sup>7</sup> are as defined above.

Compounds of formula (VII) and (VIIA) may be prepared by cyclisation of a compound of formula (XI)

(XI)

where R<sup>4</sup>, R<sup>5</sup>, R<sup>6</sup> and R<sup>7</sup> are as defined above and R<sup>42</sup> and R<sup>43</sup> represent a combination of moieties which can cyclise to form an appropriately substituted pyrrole ring. For example, R<sup>42</sup> can be a group of formula -CH=C(R<sup>44</sup>)N<sub>3</sub> where R<sup>44</sup> is a group R<sup>2</sup> as defined above, or a protected form thereof, and R<sup>43</sup> may be hydrogen. Cyclisation to form a compound of formula (XII) may then be effected by heating for example under reflux in an organic solvent, in particular a high boiling aprotic solvent such as xylene or toluene.

Alternatively,  $R^{43}$  may be nitro and  $R^{42}$  may be a group of formula  $-\text{CH}_2\text{C}(\text{O})\text{R}^{2'}$  where  $\text{R}^{2'}$  is as defined above in relation to formula (VII). These compounds will cyclise in the presence of a catalyst such as palladium on carbon in the presence of hydrogen. The reaction may be effected at moderate temperatures for example of from 0 to 80°C, conveniently at about ambient temperature.

Thus examples of compounds of formula (XI) include compounds of formula (XII) and (XIII)

10

(XIII)

(XIV)

15 where  $\text{R}^{2'}$ ,  $\text{R}^4$ ,  $\text{R}^5$ ,  $\text{R}^6$  and  $\text{R}^7$  are as hereinbefore defined and  $\text{R}^{3''}$  is a group  $\text{R}^{3'}$  or is hydrogen, which may be converted later to a group  $\text{R}^3$  or  $\text{R}^{3'}$ .

Compounds of formula (XIII) where  $\text{R}^{3'}$  is hydrogen may be prepared for example by reacting a compound of formula (XV)

-20-

(XV)

with a compound of formula (XVI)

(XVI)

5

where R<sup>4</sup>, R<sup>5</sup>, R<sup>6</sup>, R<sup>7</sup>, and R<sup>2'</sup> are as defined hereinbefore. The reaction may be effected in an organic solvent such as ethanol at low temperatures of from -20 to 0°C, suitably at about 0°C. The reaction is suitably effected in the presence of a base such as an alkoxide, in particular an ethoxide, for example potassium ethoxide.

10

Compounds of formula (XVI) are suitably prepared by reacting a compound of formula (XVII)

(XVII)

15

where R<sup>3</sup> and R<sup>2'</sup> are as defined above and R<sup>47</sup> is a leaving group such as halide and in particular bromide, with an azide salt, such as an alkali metal azide salt in particular sodium azide.

Compounds of formula (XIV) may be prepared by reacting a compound of formula (XVIII)

(XVIII)

20

where R<sup>5</sup>, R<sup>6</sup>, R<sup>7</sup>, R<sup>3</sup>, R<sup>4</sup> and R<sup>2'</sup> are as defined above, with a compound of formula (XIX)

(XIX)

where R<sup>2'</sup> is as defined above and R<sup>48</sup> leaving group such as hydroxy. Examples of compounds of formula (XVI) are oxalates such as diethyloxalate. The reaction is suitably effected in the presence of a base such as sodium hydride in an organic solvent such as THF. Moderate temperatures of from 0° to 40°C and conveniently ambient temperature is employed.

According to a further aspect of the invention there is provided a compound of the formula (I) as defined herein, or a pharmaceutically acceptable salt or an *in vivo* hydrolysable ester thereof, for use in a method of treatment of the human or animal body by therapy. In particular, the compounds are used in methods of treatment of inflammatory disease.

According to a further aspect of the present invention there is provided a method for antagonising an MCP-1 mediated effect in a warm blooded animal, such as man, in need of such treatment, which comprises administering to said animal an effective amount of a compound of formula (I), or a pharmaceutically acceptable salt, or an *in vivo* hydrolysable ester thereof.

The invention also provides a compound of formula (I) as defined herein, or a pharmaceutically acceptable salt, or an *in vivo* hydrolysable ester thereof, for use as a medicament.

The compositions of the invention may be in a form suitable for oral use (for example as tablets, lozenges, hard or soft capsules, aqueous or oily suspensions, emulsions, dispersible powders or granules, syrups or elixirs), for topical use (for example as creams, ointments, gels, or aqueous or oily solutions or suspensions), for administration by inhalation (for example as a finely divided powder or a liquid aerosol), for administration by insufflation (for example as a finely divided powder) or for parenteral administration (for example as a sterile aqueous or oily solution for intravenous, subcutaneous, intramuscular or intramuscular dosing or as a suppository for rectal dosing).

The compositions of the invention may be obtained by conventional procedures using conventional pharmaceutical excipients, well known in the art. Thus, compositions intended

for oral use may contain, for example, one or more colouring, sweetening, flavouring and/or preservative agents.

Suitable pharmaceutically acceptable excipients for a tablet formulation include, for example, inert diluents such as lactose, sodium carbonate, calcium phosphate or calcium carbonate, granulating and disintegrating agents such as corn starch or algenic acid; binding agents such as starch; lubricating agents such as magnesium stearate, stearic acid or talc; preservative agents such as ethyl or propyl p-hydroxybenzoate, and anti-oxidants; such as ascorbic acid. Tablet formulations may be uncoated or coated either to modify their disintegration and the subsequent absorption of the active ingredient within the gastrointestinal track, or to improve their stability and/or appearance, in either case, using conventional coating agents and procedures well known in the art.

Compositions for oral use may be in the form of hard gelatin capsules in which the active ingredient is mixed with an inert solid diluent, for example, calcium carbonate, calcium phosphate or kaolin, or as soft gelatin capsules in which the active ingredient is mixed with water or an oil such as peanut oil, liquid paraffin, or olive oil.

Aqueous suspensions generally contain the active ingredient in finely powdered form together with one or more suspending agents, such as sodium carboxymethylcellulose, methylcellulose, hydroxypropylmethylcellulose, sodium alginate, polyvinyl-pyrrolidone, gum tragacanth and gum acacia; dispersing or wetting agents such as lecithin or condensation products of an alkylene oxide with fatty acids (for example polyoxyethylene stearate), or condensation products of ethylene oxide with long chain aliphatic alcohols, for example heptadecaethyleneoxycetanol, or condensation products of ethylene oxide with partial esters derived from fatty acids and a hexitol such as polyoxyethylene sorbitol monooleate, or condensation products of ethylene oxide with long chain aliphatic alcohols, for example heptadecaethyleneoxycetanol, or condensation products of ethylene oxide with partial esters derived from fatty acids and a hexitol such as polyoxyethylene sorbitol monooleate, or condensation products of ethylene oxide with partial esters derived from fatty acids and hexitol anhydrides, for example polyethylene sorbitan monooleate. The aqueous suspensions may also contain one or more preservatives (such as ethyl or propyl p-hydroxybenzoate, anti-oxidants (such as ascorbic acid), colouring agents, flavouring agents, and/or sweetening agents (such as sucrose, saccharine or aspartame).

Oily suspensions may be formulated by suspending the active ingredient in a vegetable oil (such as arachis oil, olive oil, sesame oil or coconut oil) or in a mineral oil (such as liquid paraffin). The oily suspensions may also contain a thickening agent such as beeswax, hard paraffin or cetyl alcohol. Sweetening agents such as those set out above, and flavouring agents  
5 may be added to provide a palatable oral preparation. These compositions may be preserved by the addition of an anti-oxidant such as ascorbic acid.

Dispersible powders and granules suitable for preparation of an aqueous suspension by the addition of water generally contain the active ingredient together with a dispersing or wetting agent, suspending agent and one or more preservatives. Suitable dispersing or wetting  
10 agents and suspending agents are exemplified by those already mentioned above. Additional excipients such as sweetening, flavouring and colouring agents, may also be present.

The pharmaceutical compositions of the invention may also be in the form of oil-in-water emulsions. The oily phase may be a vegetable oil, such as olive oil or arachis oil, or a mineral oil, such as for example liquid paraffin or a mixture of any of these. Suitable  
15 emulsifying agents may be, for example, naturally-occurring gums such as gum acacia or gum tragacanth, naturally-occurring phosphatides such as soya bean, lecithin, an esters or partial esters derived from fatty acids and hexitol anhydrides (for example sorbitan monooleate) and condensation products of the said partial esters with ethylene oxide such as polyoxyethylene sorbitan monooleate. The emulsions may also contain sweetening, flavouring and preservative  
20 agents.

Syrups and elixirs may be formulated with sweetening agents such as glycerol, propylene glycol, sorbitol, aspartame or sucrose, and may also contain a demulcent, preservative, flavouring and/or colouring agent.

The pharmaceutical compositions may also be in the form of a sterile injectable  
25 aqueous or oily suspension, which may be formulated according to known procedures using one or more of the appropriate dispersing or wetting agents and suspending agents, which have been mentioned above. A sterile injectable preparation may also be a sterile injectable solution or suspension in a non-toxic parenterally-acceptable diluent or solvent, for example a solution in 1,3-butanediol.

30 Suppository formulations may be prepared by mixing the active ingredient with a suitable non-irritating excipient which is solid at ordinary temperatures but liquid at the rectal

temperature and will therefore melt in the rectum to release the drug. Suitable excipients include, for example, cocoa butter and polyethylene glycols.

Topical formulations, such as creams, ointments, gels and aqueous or oily solutions or suspensions, may generally be obtained by formulating an active ingredient with a  
5 conventional, topically acceptable, vehicle or diluent using conventional procedure well known in the art.

Compositions for administration by insufflation may be in the form of a finely divided powder containing particles of average diameter of, for example, 30 $\mu$  or much less, the powder itself comprising either active ingredient alone or diluted with one or more  
10 physiologically acceptable carriers such as lactose. The powder for insufflation is then conveniently retained in a capsule containing, for example, 1 to 50mg of active ingredient for use with a turbo-inhaler device, such as is used for insufflation of the known agent sodium cromoglycate.

Compositions for administration by inhalation may be in the form of a conventional  
15 pressurised aerosol arranged to dispense the active ingredient either as an aerosol containing finely divided solid or liquid droplets. Conventional aerosol propellants such as volatile fluorinated hydrocarbons or hydrocarbons may be used and the aerosol device is conveniently arranged to dispense a metered quantity of active ingredient.

For further information on Formulation the reader is referred to Chapter 25.2 in  
20 Volume 5 of Comprehensive Medicinal Chemistry (Corwin Hansch; Chairman of Editorial Board), Pergamon Press 1990.

The amount of active ingredient that is combined with one or more excipients to produce a single dosage form will necessarily vary depending upon the host treated and the particular route of administration. For example, a formulation intended for oral administration  
25 to humans will generally contain, for example, from 0.5 mg to 2 g of active agent compounded with an appropriate and convenient amount of excipients which may vary from about 5 to about 98 percent by weight of the total composition. Dosage unit forms will generally contain about 1 mg to about 500 mg of an active ingredient. For further information on Routes of Administration and Dosage Regimes the reader is referred to Chapter 25.3 in  
30 Volume 5 of Comprehensive Medicinal Chemistry (Corwin Hansch; Chairman of Editorial Board), Pergamon Press 1990.

The size of the dose for therapeutic or prophylactic purposes of a compound of the Formula I will naturally vary according to the nature and severity of the conditions, the age and sex of the animal or patient and the route of administration, according to well known principles of medicine. As mentioned above, compounds of the Formula I are useful in  
5 treating diseases or medical conditions which are due alone or in part to the effects of farnesylation of rats.

In using a compound of the Formula I for therapeutic or prophylactic purposes it will generally be administered so that a daily dose in the range, for example, 0.5 mg to 75 mg per kg body weight is received, given if required in divided doses. In general lower doses will be  
10 administered when a parenteral route is employed. Thus, for example, for intravenous administration, a dose in the range, for example, 0.5 mg to 30 mg per kg body weight will generally be used. Similarly, for administration by inhalation, a dose in the range, for example, 0.5 mg to 25 mg per kg body weight will be used. Oral administration is however preferred.

**Example 32****15 Biological Assays for hMCP-1 Antagonists****a) hMCP-1 Receptor-binding assay****i) Cloning and expression of hMCP-1 receptor**

The MCP-1 receptor B (CCR2B) cDNA was cloned by PCR from THP-1 cell RNA using suitable oligonucleotide primers based on the published MCP-1 receptor sequences (Charo *et al.*, 1994, *Proc. Natl. Acad. Sci. USA*, **91**, 2752). The resulting PCR products were cloned into vector PCR-II™ (InVitrogen, San Diego, CA.). Error free CCR2B cDNA was subcloned as a Hind III-Not I fragment into the eukaryotic expression vector pCDNA3 (InVitrogen) to generate pCDNA3/CC-CKR2A and pCDNA3/CCR2B respectively.

Linearised pCDNA3/CCR2B DNA was transfected into CHO-K1 cells by calcium phosphate precipitation (Wigler *et al.*, 1979, *Cell*, **16**, 777). Transfected cells were selected by the addition of Geneticin Sulphate (G418, Gibco BRL) at 1mg/ml, 24 hours after the cells had been transfected. Preparation of RNA and Northern blotting were carried out as described previously (Needham *et al.*, 1995, *Prot. Express. Purific.*, **6**, 134). CHO-K1 clone 7 (CHO-CCR2B) was identified as the highest MCP-1 receptor B expressor.

**30 ii) Preparation of membrane fragments**

CHO-CCR2B cells were grown in DMEM supplemented with 10% foetal calf serum, 2 mM glutamine, 1x Non-Essential Amino Acids, 1x Hypoxanthine and Thymidine

Supplement and Penicillin-Streptomycin (at 50 µg streptomycin/ml, Gibco BRL). Membrane fragments were prepared using cell lysis/differential centrifugation methods as described previously (Siciliano *et al.*, 1990, *J. Biol. Chem.*, **265**, 19658). Protein concentration was estimated by BCA protein assay (Pierce, Rockford, Illinois) according to the manufacturer's instructions.

### iii) Assay

<sup>125</sup>I MCP-1 was prepared using Bolton and Hunter conjugation (Bolton *et al.*, 1973, *Biochem. J.*, **133**, 529; Amersham International plc]. Equilibrium binding assays were carried out using the method of Ernst *et al.*, 1994, *J. Immunol.*, **152**, 3541. Briefly, varying amounts of <sup>125</sup>I-labeled MCP-1 were added to 10 mg of purified CHO-CCR2B cell membranes in 100 ml of Binding Buffer. After 1 hour incubation at room temperature the binding reaction mixtures were filtered and washed 5 times through a plate washer (Packard Harvester Filtermate™ 196). Scintillation fluid (25µl, Microscint™-20, a high efficiency liquid scintillation counting cocktail for aqueous samples) was added to each well and the plate was covered with plate sealer and counted (Packard Top Count™). Cold competition studies were performed as above using 100 pM <sup>125</sup>I-labeled MCP-1 in the presence of varying concentrations of unlabelled MCP-1. Non-specific binding was determined by the inclusion of a 200-fold molar excess of unlabelled MCP-1 in the reaction.

Ligand binding studies with membrane fragments prepared from CHO-CCR2B cells showed that the CCR2B was present at a concentration of 0.2 pmoles/mg of membrane protein and bound MCP-1 selectively and with high affinity (IC<sub>50</sub> = 110 pM, K<sub>d</sub> = 120 pM). Binding to these membranes was completely reversible and reached equilibrium after 45 minutes at room temperature, and there was a linear relationship between MCP-1 binding and CHO-CCR2B cell membrane concentration when using MCP-1 at concentrations between 100 pM and 500 pM.

Test compounds dissolved in DMSO (5 µl) were tested in competition with 100 pM labelled MCP-1 over a concentration range (0.1-200µM) in duplicate using eight point dose-response curves and IC<sub>50</sub> concentrations were calculated.

Compounds tested of the present invention had IC<sub>50</sub> values of 50µM or less in the hMCP-1 receptor binding assay described herein. For example Compound 81 had an IC<sub>50</sub> of 6.86µM.

### b) MCP-1 mediated calcium flux in THP-1 cells

The human monocytic cell line THP-1 was grown in a synthetic cell culture medium RPMI 1640 supplemented with 10 % foetal calf serum, 2 mM glutamine and Penicillin-Streptomycin (at 50 µg streptomycin/ml, Gibco BRL). THP-1 cells were washed in HBSS (lacking  $\text{Ca}^{2+}$  and  $\text{Mg}^{2+}$ ) + 1 mg/ml BSA and resuspended in the same buffer at a density of  $3 \times 10^6$  cells/ml. The cells were then loaded with 1 mM FURA-2/AM for 30 min at 37°C, washed twice in HBSS, and resuspended at  $1 \times 10^6$  cells/ml. THP-1 cell suspension (0.9 ml) was added to a 5 ml disposable cuvette containing a magnetic stirrer bar and 2.1 ml of prewarmed (37°C) HBSS containing 1 mg/ml BSA, 1 mM  $\text{MgCl}_2$  and 2 mM  $\text{CaCl}_2$ . The cuvette was placed in a fluorescence spectrophotometer (Perkin Elmer, Norwalk, CT) and preincubated for 4 min at 37°C with stirring. Fluorescence was recorded over 70 sec and cells were stimulated by addition of hMCP-1 to the cuvette after 10 sec.  $[\text{Ca}^{2+}]_i$  was measured by excitation at 340 nm and 380 nm alternately and subsequent measurement of the intensity of the fluorescence emission at 510 nm. The ratio of the intensities of the emitted fluorescent light following excitation at 340 nm and 380 nm, (R), was calculated and displayed to give and estimate of cytoplasmic  $[\text{Ca}^{2+}]$  according to the equation:-

$$[\text{Ca}^{2+}]_i = K_d \frac{(R - R_{\min})}{(R_{\max} - R)} \left( \frac{Sf2/Sb2}{Sf2/Sb2} \right)$$

where the  $K_d$  for FURA-2  $\text{Ca}^{2+}$  complex at 37°C was taken to be 224 nM.  $R_{\max}$  is the maximal fluorescence ratio determined after addition of 10 mM Ionomycin,  $R_{\min}$  is the minimal ratio determined by the subsequent addition of a  $\text{Ca}^{2+}$  free solution containing 5 mM EGTA, and  $Sf2/Sb2$  is the ratio of fluorescence values at 380 nm excitation determined at  $R_{\min}$  and  $R_{\max}$ , respectively.

Stimulation of THP-1 cells with hMCP-1 induced a rapid, transient rise in  $[\text{Ca}^{2+}]_i$  in a specific and dose dependent manner. Dose response curves indicated an approximate  $\text{EC}_{50}$  of 2 nM. Test compounds dissolved in DMSO (10 µl) were assayed for inhibition of calcium release by adding them to the cell suspension 10 sec prior to ligand addition and measuring the reduction in the transient rise in  $[\text{Ca}^{2+}]_i$ . Test compounds were also checked for lack of agonism by addition in place of hMCP-1.

### 30 c) hMCP-1 mediated chemotaxis and RANTES assay.

*In vitro* chemotaxis assays were performed using either the human monocytic cell line THP-1 or peripheral blood mixed monocytes obtained from fresh human blood purified by

erythrocyte sedimentation followed by density gradient centrifugation over 9.6 %(w/v) sodium metrizoate and 5.6 %(w/v) polysaccharide, density 1.077 g/ml (Lymphoprep™ Nycomed). Cell migration through polycarbonate membranes was measured by enumerating those passing through either directly by Coulter counting or indirectly by use of a colourimetric viability assay measuring the cleavage of a tetrazolium salt by the mitochondrial respiratory chain (Scudiero D.A. *et al.* 1988, *Cancer Res.*, **48**, 4827-4833).

Chemoattractants were introduced into a 96-well microtiter plate which forms the lower well of a chemotaxis chamber fitted with a PVP-free 5 µm poresize polycarbonate adhesive framed filter membrane (NeuroProbe MB series, Cabin John, MD 20818, USA) according to the manufacturer's instructions. The chemoattractant was diluted as appropriate in synthetic cell culture medium, RPMI 1640 (Gibco) or supplemented with 2 mM glutamine and 0.5% BSA, or alternatively with HBSS with Ca<sup>2+</sup> and Mg<sup>2+</sup> without Phenol Red (Gibco) plus 0.1% BSA. Each dilution was degassed under vacuum for 30 min and was placed (400 µl) in the lower wells of the chamber and THP-1 cells (5x10<sup>5</sup> in 100 µl RPMI 1640 + 0.5% BSA) were incubated in each well of the upper chamber. For the inhibition of chemotaxis the chemoattractant was kept at a constant submaximal concentration determined previously for each chemokine (1 nM for MCP-1 and 2 nM for RANTES) and added to the lower well together with the test compounds dissolved in DMSO (final DMSO concentration < 0.05% v/v) at varying concentrations. The chamber was incubated for 2 h at 37°C under 5 % CO<sub>2</sub>. The medium was removed from the upper wells which were then washed out with 200 µl physiological saline before opening the chamber, wiping dry the membrane surface and centrifuging the 96-well plate at 600 g for 5 min to harvest the cells. Supernatant (150 µl) was aspirated and 10 µl of cell proliferation reagent, WST-1, {4-[3-(4-iodophenyl)-2-(4-nitrophenyl)-2H-5-tetrazolio]-1,3-phenyl disulfonate} plus an electron coupling reagent (Boehringer Mannheim, Cat.no. 1644 807) was added back to the wells. The plate was incubated at 37°C for 3 h and the absorbance of the soluble formazan product was read on a microtitre plate reader at 450 nm. The data was input into a spreadsheet, corrected for any random migration in the absence of chemoattractant and the average absorbance values, standard error of the mean, and significance tests were calculated. hMCP-1 induced concentration dependent cell migration with a characteristic biphasic response, maximal 0.5-1.0 nm.

In an alternative form of the above assay, fluorescently tagged cells can be used in order to assist in end point detection. In this case, the THP-1 cells used are fluorescently tagged by incubation in the presence of 5mM Calcein AM (Glycine, N,N'-[[3',6'-bis(acetyloxy)-3-oxospiro[isobenzofuran-1(3H),9'-[9H]xanthene]-2',7'-

- 5 diyl]bis(methylene)]bis[N-[2-[(acetyloxy)methoxy]-2-oxoethyl]]-bis[(acetyloxy)methyl] ester; Molecular Probes) for 45 minutes in the dark. Cells are harvested by centrifugation and resuspended in HBSS (without Phenol Red) with Ca<sup>2+</sup>, Mg<sup>2+</sup> and 0.1% BSA. 50ml (2x10<sup>5</sup> cells) of the cell suspension are placed on the filter above each well and, as above, the unit is incubated at 37°C for 2 hours under 5% CO<sub>2</sub>. At the end of the incubation, cells are washed
- 10 off the upper face of the filter with phosphate buffered saline, the filter removed from the plate and the number of cells attracted to either the underside of the filter or the lower well estimated by reading fluorescence at 485nm excitation, 538nm emission wavelengths (fmax, Molecular Devices). The data was input into a spreadsheet, corrected for any random migration in the absence of chemoattractant and the average fluorescence values, standard
- 15 error of the mean, percentage inhibition and IC<sub>50</sub> of compounds under test and significance tests can be calculated.

For example, using this method, compound No. 14 in Table I showed an IC<sub>50</sub> of 11.4µM in the hMCP-1 chemotaxis assay and compound No.23 in Table 1 showed an IC<sub>50</sub> of 2.95µM in the RANTES chemotaxis assay.

- 20 No physiologically unacceptable toxicity was observed at the effective dose for compounds tested of the present invention.
